

WEEK 1 STATUS REPORT

CCP-CNS2026 — Problem 1: Multi-Site Enterprise Network

Team Members: Rohma , Muqadas, Ahmad

Instructor: Tahir Mehmood

TASKS COMPLETED THIS WEEK:

1. Created GitHub repository (CNS2026-Problem1)

- Added configs, docs and pcaps folders
- Written README with project description

2. Designed network topology

- Created logical topology diagram on draw.io
- Uploaded to GitHub docs/ folder

3. Created IP addressing plan

- Three VLANs: Sales (10), Engineering (20), Admin (30)
- Uploaded IP_Plan.xlsx to GitHub docs/ folder

4. Written Team Charter

- Defined all roles and weekly goals
-

NETWORK DESIGN DECISIONS:

- Router-on-a-Stick chosen because only one physical router is needed for all 3 VLANs
- Separate subnets for each VLAN for security
- Web server placed in Admin VLAN (most secure)
- Kali Linux placed in Sales VLAN to simulate a realistic internal attack

RISKS IDENTIFIED:

- Packet Tracer has limited attack simulation

Workaround: Use built-in traffic tools

PLAN FOR NEXT WEEK:

- Build full network topology in Packet Tracer
- Configure VLANs on switch
- Configure router-on-a-stick
- Set up DHCP for all VLANs
- Test all connectivity with ping tests
